

## \* Measure of location :-

① mean  
المتوسط الحسابي

$$* \bar{x} = \frac{\sum x}{n}$$

\* oversensitive to extreme values.

\* some properties

$$\rightarrow y_i = c x_i$$

$$\hookrightarrow \bar{y} = c \bar{x}$$

$$\rightarrow y_i = x_i + c$$

$$\hookrightarrow \bar{y} = \bar{x} + c$$

$$\rightarrow y_i = x_i - c$$

$$\hookrightarrow \bar{y} = \bar{x} - c$$

(يضعف أثر المتوسط الحسابي يتأثر بالكميات الحسابية)

② median  
(الوسيط)  
 $Q_2$

\* أفضل مؤشر لـ Data (مفهم)

Ex: 3, 4, 2, 5

\* نرتب القيم

2, 3, 4, 5

\* يوجد حالتين للـ

الزوجي      الفردي

Ex: 2, 3, 4, 5

$$\frac{3+4}{2} = 3.5$$

الوسيط

Ex: 2, 3, 4, 5, 6

الوسيط

③ mode

المسئول

العدد الأكثر تكراراً

Ex: 2, 3, 4, 5, 5, 6

mode: 5

mode

unimodel  $\rightarrow$  1

Bimodel  $\rightarrow$  2

Trimodel  $\rightarrow$  3

## \* Measure of spread :-

① The Range  
\* is very sensitive to extreme outliers.

\* is the difference between the largest and smallest observation in a sample

② Variance and standard Deviation

التباين والإختلاف المعياري

$$s^2 = \frac{\sum (x - \bar{x})^2}{n - 1}$$

$$s^2 = \frac{\sum x^2}{n - 1} - \frac{(\sum x)^2}{n(n - 1)}$$

## ② properties of variance and standard deviation:-

$$\rightarrow y_i = x_i + c$$

$$s_y^2 = s_x^2$$

$$\rightarrow y_i = x_i - c$$

$$s_y^2 = s_x^2$$

← صفت آخر لا يتأثر بـ +, -

$$\rightarrow y_i = c x_i$$

$$s_y^2 = c^2 s_x^2$$

→ The variance can't be negative

## ③ Quantiles or percentiles:-

Q<sub>1</sub>:- Lower quartile = 25%

\* percentiles are less sensitive to outliers

Q<sub>2</sub>:- median = 50%

Q<sub>3</sub>:- upper quartile = 75%

$$P_p = \frac{n \cdot p}{100} \quad \begin{array}{l} n:- \text{sample size} \\ p:- \text{percent} \end{array}$$

↓ لاحظ اليها نواتج مرتبة

Ex:- 1, 2, 3, 4, 6  
 $n=4$       $p=35$  →  $\frac{3}{4}$  بالأسفل

$$P_p = \frac{4 \times 35}{100} = 1.4^{\text{th}}$$

تقريب القيمة  $\approx 2^{\text{th}}$   
 لا تقرب عدد صحيح = 3

Ex:- 1, 2, 3, 4  
 $n=4$       $p=25\%$

$$P_p = \frac{4 \times 25}{100} = 1^{\text{th}}$$

$$\frac{1^{\text{th}} + 2^{\text{th}}}{2} = \frac{1+2}{2} = 1.5$$

\* coefficient of variation  
 $CV = \frac{s}{\bar{x}} * 100\%$

# Outliers or Extreme Values

→ Inter-quartile Rang

$$IQR = Q_3 - Q_1$$

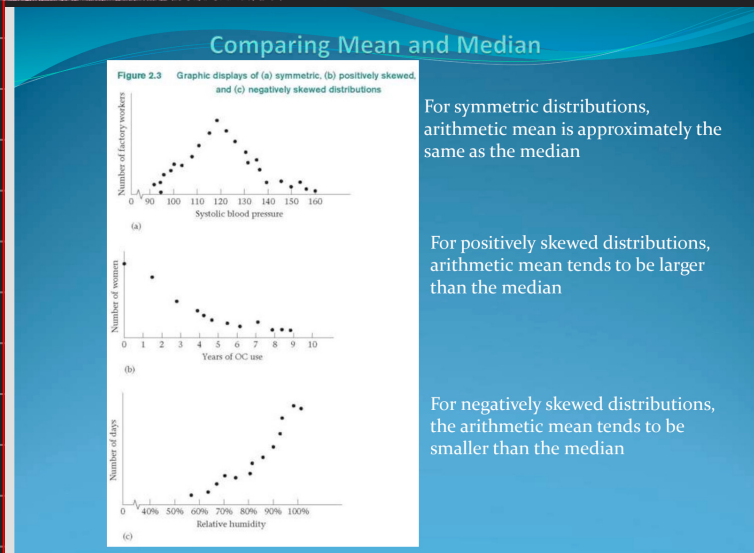

→ outlier from right

$$Q_3 + 1.5(IQR)$$

→ outlier from left

$$Q_1 - 1.5(IQR)$$

سُبْحَانَ اللَّهِ وَبِحَمْدِهِ  
عَدَدَ خَلْفِهِ ، وَرِضًا نَفْسِهِ ،  
وَزِينَةً عَرْشِهِ ، وَمِدَادَ كَلِمَاتِهِ ..

negatively skewed distribution  
 $mode > Q_2 > \bar{x}$

symmetric

positively skewed distributions  
 $mode < Q_2 < \bar{x}$

# Box plot
